SDK (Embedded Computers)

Leverage ATOP's rugged industrial hardware to run your applications

————— page 4

SDK version comes with an easily programmable embedded edge computer with cloud connectivity. Few highlights are:

- ATOP's customized **Linux OS**
- ATOP's **custom APIs and utilities** to control hardware with a wide variety of programming solutions
- An integrated **Building Block programming environment**, in addition to C programming. The embedded **Node-RED** environment includes a wide range of customized APIs, allowing you to access hardware through a visual programming environment.

To learn more about our edge computing, check out our Embedded Computing Brochure.

Serial Device Servers

Communicate with legacy devices leveraging your Ethernet-based network

————— page 6

Serial Server Application: For transparent conversion between Serial and Ethernet.

Modbus Gateways

Seamlessly convert or concentrate Modbus RTU/ASCII data to Modbus TCP and heavily increase your application performance

————— page 9

Modbus Gateway Application: To convert from Modbus TCP to RTU/ASCII, and vice-versa.

Modbus Concentrator: For faster Modbus polling responsiveness, redundancy, and register remapping.

Protocol Gateways for Smart-Grid and Substations

Use ATOP to integrate legacy substation devices into newer networks, or vice-versa

————— page 12

Protocol Gateway: For an advanced protocol conversion applications, such as Substation and Industrial scenarios.

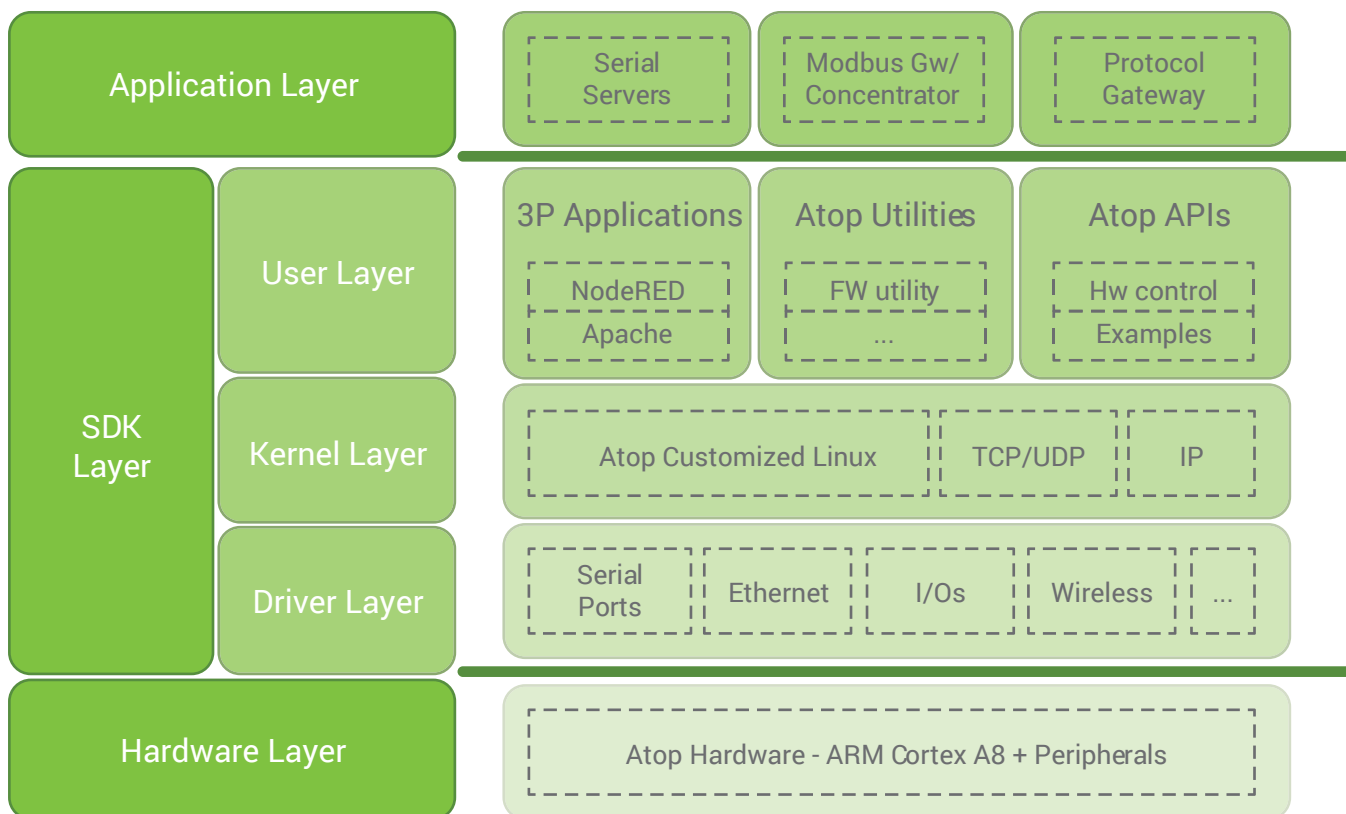

SDK (Embedded Computers)

SDK: Software development kit of ATOP platforms. A Linux based environment allowed to develop proprietary applications on ATOP SW architecture.

Supported platforms (HW support)			
SE52XX series	SE59XX series		
 SE5201 or SE5201C	 SE5901	 SE5901B platform (with 4G/LTE Cellular)	 SE5904D
 SE5202	 SE5908/SE5916	 SE5908A/SE5916A (IEC61850-3 certified)	

Features:

- FW redundancy mechanism in , avoid device crashed during FW upgrade/downgrade process
- Rich example codes of C and WEB, easily developing proprietary WEB style and applications
- Flexible architecture, easily add 3rd party source, applications, scripts in the SDK

Serial Device Servers

At ATOP we understood that it can be difficult to integrate various application needs. So, we develop solutions that bring interoperability between various hardware and software platforms. In addition, we develop with a product strategy in mind, so that flexibility and network scalability are factored in to provide solutions that are fit for the future.

Families

Entry Level

A low-cost, hardened hardware device for serial server applications in standard operating environments in normal temperature ranges, with basic functionalities and semi-industrial EMC protection.

Wireless

Designed to equip serial server functionality with wireless connectivity, our wireless devices support 3G and 4G or IEEE 802.11abgn and IEEE 802.11bgn.

Advanced

By featuring a high-powered industrial CPU and high EMC protection at Levels 3 to 5 or IEC61850-3, these advanced serial servers provide performance and scalability for Modbus Gateways, Modbus Concentrators, Protocol Gateways, and programmable environment support (SDK), in which you can write your own software in C or build your own IIoT application with a visual building-block tool.

Enterprise

Fanless and industrial, but with high port density, these devices are helpful to be used to remotely manage via console switches or routers deployed in large data centers without the physical operator needed to be on site.

Modbus Gateways

Why Modbus?

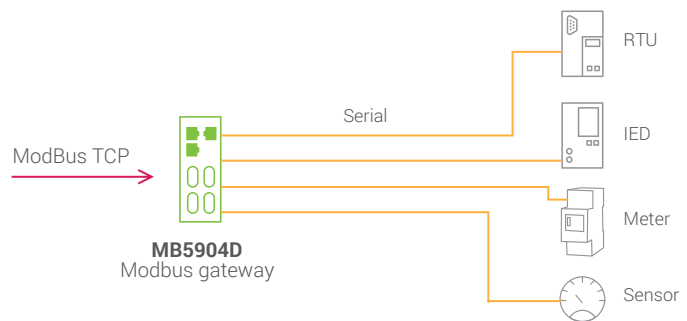

Modbus is one of the most popular and trusted protocols, with Modbus RTU (for serial connection) and Modbus TCP/IP (for Ethernet Networks) are normally used as the backbone preference in industrial automation, substation automation, and building automation solutions. To address the slow migration of communication standards from Serial- to Ethernet-based devices, ATOP has a complete range of Modbus Gateway devices to act converters to facilitate this migration, while extending the life of previous investment costs.

Product Line Overview

Entry level - Modbus Gateway

FEATURES

- Low-cost, easy to apply.
- Seamlessly provides conversion between ethernet-based Modbus TCP and serial-based Modbus RTU/ASCII.
- Suitable for periodic data polling. Frequent pollings may cause long latencies and Modbus TCP Timeouts.

Advanced - Concentrator

FEATURES

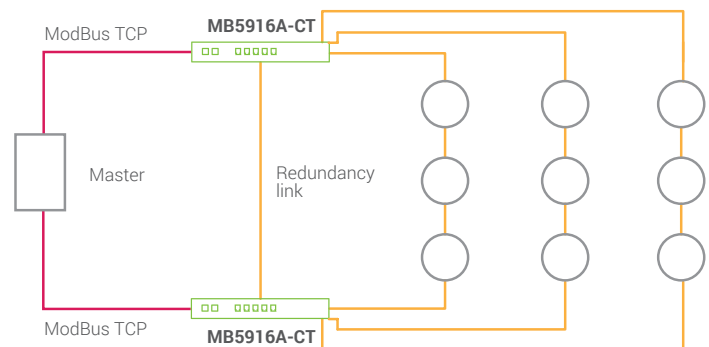

- Suitable for frequent polling requests from multiple devices.
- Allows data to be polled automatically from slave devices. Data will be available for master polling at all times.
- Faster responsiveness, removing the risk of Modbus TCP timeouts.
- Customizable register mapping to optimize different masters needing to access different data structures.
- Supports link status and data timestamp access.

Top of the line - Redundant Concentrator

FEATURES

- All features of the Advanced Concentrator.
- Redundant architecture for the most mission critical applications. Automatic link recovery in case of Ethernet or Serial link failure.
- Supports link status and data timestamp access.
- High performance, reliability, and EMC protection.

Automatic polling from serial ports with link failure recovery mechanism.

Modbus Redundant Concentrator Success Story

Modbus Redundant Concentrator

Challenge: To manage through a Modbus TCP SCADA a large low-voltage substation infrastructure is Modbus RTU-based. The infrastructure is very complex, with each switchboard involving around 190 slaves that need to be accessed simultaneously for data, diagnostics, and configuration.

Location: Malaysia, Petrochemical and Refinery Complex

Protocol used: Modbus TCP/Modbus RTU.

Requirements: Short failure recovery time; very efficient Modbus polling in an environment with a high density of devices.

Challenges

- Supporting system integrator to define the topology.
- Customizing hardware with redundant Modbus concentrators with fiber uplink – 16 serial ports.
- Adjusting command priority to ensure each poll command can be executed within 600ms.
- Integration of customer's device management tool.
- On-site setup, config., test and troubleshooting.
- User-friendly configuration: development of a colored-block UI to identify memory area and enable easy set up of the memory mapping.

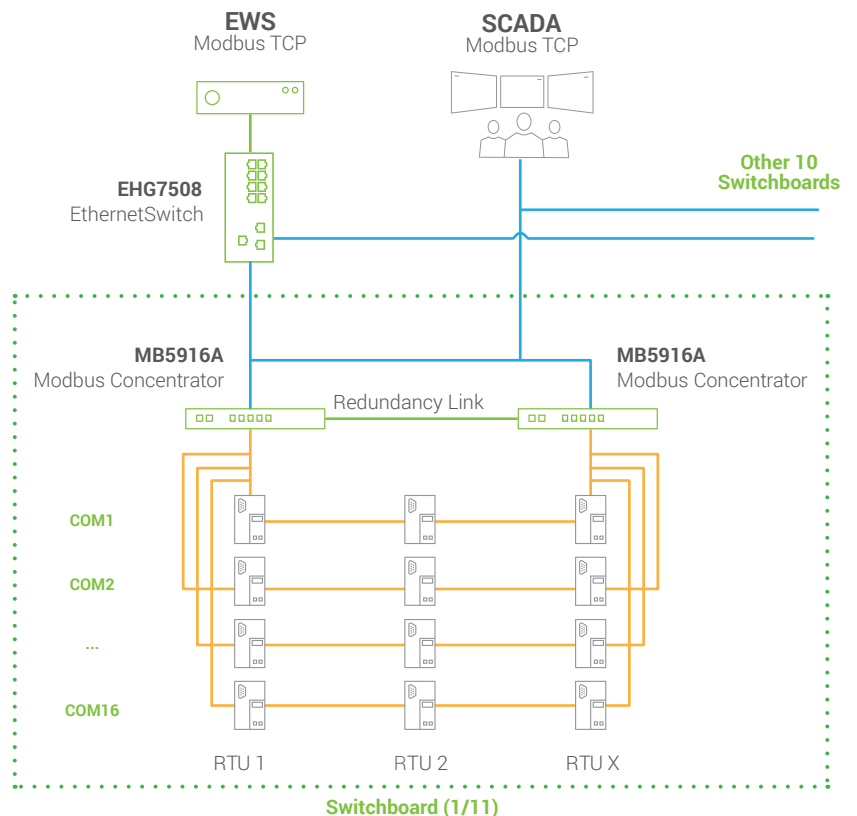

Solution provided

- Modbus redundant concentrators designed and set up in pairs, with redundancy fiber link between them and COM links that start from one device and end with the another.
- Software customization and optimization.
- Managed Ethernet switches providing the backbone to the customer's EWS.

Results achieved

- 600 ms complete polling for more than 100 slaves, each with 20 registers (19200 bps).
- 500 ms secondary recovery to handle primary device downtime or device failure.
- Multi-write command to map different slaves simultaneously to improve efficiency.

Protocol Gateways for Smart-Grid and Substations

Substation retrofitting

IEC 61850 standard saw quick adoption from utilities across the world. It not only enabled high levels of interoperability between devices from different manufacturers but also provided advanced means of communication. Electrical grid system is a large power distribution network that went through decades of development. Generally, the power utilities invest in the latest technologies available to them at the times of their installations such as the latest IEC 61850 compliant equipment.

However, the life-time of the equipment in the grid system can typically span several years as a life-cycle of a substation can be more than 50 years. Replacement of latest devices ahead of time is out of the question due to their substantial investments. Therefore, the legacy equipment will normally remain in use and the power grid is naturally equipped with both legacy and new technologies. The challenge for the smart grid system is to continue developing the power grid with a focus on enabling enhanced monitoring and control across the electrical distribution network by integrating newer and legacy technologies with seamless control and supervision.

Integrating Legacy Protocols in the Smart Grid

ATOP's broad product range has been specifically designed to allow seamless integration as simple as possible. Legacy substations operating with outdated or unpopular protocols may remain in place and can be connected to the new network through ATOP's Protocol Gateways. Our powerful hardware platform with a stable and reliable software will manage the translation from protocol to protocol transparently. As a highly reliable and fault-tolerant industrial Protocol Gateways featuring integrated 3G/4G connectivity.

ATOP's user-friendly configuration tool will help the customer or the system integration to map data points. Rugged and reliable, they command within minutes by enabling the customer to manage changeovers, upgrades, or integrations in a fast and cost effective way.

To support the customer easily handling these challenges, ATOP offers more than 80 different protocol combinations that are available on 10 different hardware platforms empowering the customer to choose among hundreds of different products!

Modbus TCP	Ethernet	Client/Server
DNP 3.0 over Serial	RS-485 ; RS-232 ; RS-422	Master/Slave
DNP 3.0 over Ethernet	Ethernet	Client/Server
IEC 60870-5-101	RS-485 ; RS-232 ; RS-422	Master/Slave
IEC 60870-5-103	RS-485 ; RS-232 ; RS-422	Master/Slave
IEC 60870-5-104	Ethernet	Client/Server
IEC 61850	Ethernet	Client/Server

Hardware platforms

	Hardware	Mount	Ethernet Ports	RS-485 RS-232 RS-422 ports	Additional features
	PG5901	Din-Rail	2 (RJ45)	1 (TB5 or DB9)	can be PoE-powered [optional]
	PG5901B	Din-Rail	w1 (RJ45)	1 (DB9 vers.) / 2 (TB14 I/O vers.)	4G LTE or 3G connectivity
	PG5904D-4P	Din-Rail	2 (RJ45 or SFP)	4 (TB5 or DB9)	can be PoE-powered [optional]
	PG5908	Rack-Mount	2 (RJ45)	8 (RJ45)	
	PG5916	Rack-Mount	2 (RJ45)	16 (RJ45)	
	PG5900A	Rack-Mount	6 (SFP or RJ45)		
	PG5908A	Rack-Mount	6 (SFP or RJ45)	8 (TB5 or DB9)	
	PG5916A	Rack-Mount	6 (SFP or RJ45)	16 (TB5 or DB9)	

Supported Protocols

The ATOP Protocol Gateway Platform supports:

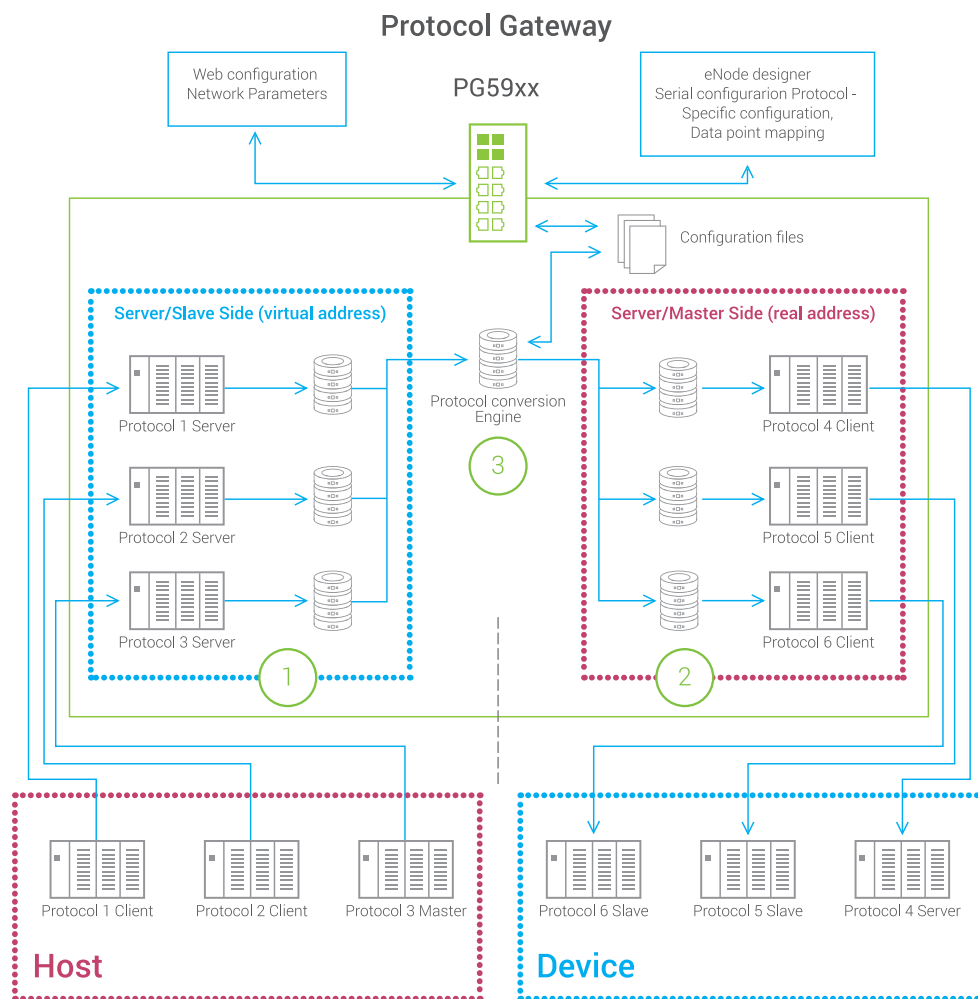

- Modbus TCP/RTU/ASCII (Ethernet and Serial) - Client/Server and Master/Slave
- DNP3.0 (Ethernet and Serial) - Client/Server and Master/Slave
- EC 60870-5-101 (Serial) - Master/Slave
- IEC 60870-5-103 (Serial) - Master/Slave
- IEC 60870-5-104 (Ethernet) - Client/Server
- IEC 61850 (Ethernet) - Client/Server

Architecture Concept

Able to run Client-Server – Master/ Slave modes at the same time, ATOP's family of Protocol Gateways are a suite of powerful industrial gateway platforms that are bundled with different protocol stacks.

The architecture is made of 3 different parts:

- ① **Device Server/Slave interface:** It listens to a Master/Client that is outside a device, such as a PLC. This means that ATOP's Protocol Gateway will behave towards an external master as a slave device and with the respective protocol.
- ② **Device Client/Master interface:** It actively polls or issues commands to an external Slave/Server.
- ③ **ADH:** The core of the unit that moves, translates, and maps the data points, commands, and events between the client and server sides.

The figure below shows the device as part of a general architecture.

The Protocol Gateway allows mapping of any protocol to any Serial or Ethernet port from the protocol itself. eNode Designer allows the user to assign different protocols to different ports, define the serial port settings, and define the protocol-specific parameters. Using eNode designer, the user can define for the Master/Client the real IDs of the devices needing to obtain data or send commands from, and will set for the Slave/Server the virtual addresses to be used from the client for data-point or command mapping.

The core of the Gateway is the Protocol Engine, in which data, commands, and events are stored and mapped to other protocols.

Appendix : Protocol Specifications

IEC61850 Server/ Client	
Supported Functions (Read, Write)	<ul style="list-style-type: none"> • Generic access to the data (Read, Write) • Clock Synchronization • 8 Logical Devices per Port
Supported Control Type of commands	<ul style="list-style-type: none"> • Direct-with-Normal-Security • Select Before Operate (SBO)-with-Normal-Security • Direct-with-Enhanced Security Select Before Operate (SBO)-with-Enhanced-Security
Implemented Protocol Subsets	<ul style="list-style-type: none"> • IEC 61850-6 (Substation Configuration Language Description: SCL) • IEC 61850-7-1 (Principles and Models) • IEC 61850-7-2 (Abstract Communication Service Interface: ACSI) • IEC 61850-7-3 (Common Data Classes: CDC) • IEC 61850-7-4 (Logical Nodes and data Object Classes) • IEC 61850-8-1 (Mapping to Manufacturing Message Specification: MMS) • Edition 1 & Edition 2 are both Supported
DNP3 Server/ Client/ Master/ Slave	
Support Level	Level 2 and subset of Level 3
General Specifications	<ul style="list-style-type: none"> • Serial Mode or Ethernet with TCP or UDP Mode • Server side supports serving up to 5 client in TCP Mode • Client side in a single RS-485 port, supports connecting up to 16 IEDs • Client side supports connecting up to 16 IEDs • Maximum Fragment size 2048 octets • Protocol implementation with configurable parameters conforms to IEEE Std 1815-2012 level 2
Supported Functions	<ul style="list-style-type: none"> • Time Synchronization generic access to the data(Read, Write) • Commands with or without preselection (Select, Operate, Direct Operate) • Transmission of time-tagged events • Counter management (Immediate Freeze, Freeze and Clear) • Self-address
Supported DNP3 Object Library	<ul style="list-style-type: none"> • Binary Inputs up to 8000 pts • Binary Outputs up to 2000 pts • Double Inputs up to 4000 pts • Analog Inputs up to 250 pts • Analog Outputs up to 250 pts • Counters up to 250 pts
Modbus Server/ Client/ Master/ Slave	
General Specifications	<ul style="list-style-type: none"> • Support Modbus RTU and ASCII in Serial mode • Support Modbus in TCP mode • For Modbus devices, support connecting up to 64 Modbus slaves/servers - client/masters • Support maximum number of data points in read direction: 8000 pts • Support maximum number of commands in write direction: 4000 pts
Supported Function Codes	<ul style="list-style-type: none"> 1: Read Coils 2: Read Discrete Inputs 3: Read Holding Registers 4: Read Input Registers 5: Write Single Coil 6: Write Single Register 15: Write Multiple Coils 16: Write Multiple Registers 43: Read Device Identification (server side only)
Supported Exception Codes	<ul style="list-style-type: none"> 1: illegal function 2: illegal data address 3: illegal data value 4: server device failure 6: server device busy

IEC 60870-5-101 Master/ Slave

General Specifications	<ul style="list-style-type: none"> • Protocol implementation with configurable parameters conforms to the IEC 60870-5-101 edition 2 specification • Process Information in Monitor and Control Direction • Balanced and Unbalanced Modes • CP24Time2a or CP56Time2a timestamp for monitor direction report
Supported Functions	<ul style="list-style-type: none"> • Station Initialization • Interrogation • Read Procedure • Cyclic Data and Spontaneous Transmission (Slave Side only) • Clock Synchronization • Transmission of Integrated Totals • Direct and SBO command
Supported Data Types	<ul style="list-style-type: none"> • Monitors Points: Each supports up to 1000 pts: Single Point, Double Point, Step Position, Bit String, Measured with Normalized Value, Measured with Scaled Value, Measured Short Floating Point Value, Integrated Totals • Control Points: Each supports up to 500 pts: Single Command, Double Command, Regulating Step Command, Set Point Command with Normalized Value, Set Point Command with Scaled Value, Set Point Command Short Floating Point, Bit string

IEC 60870-5-103 Master/ Slave

General Specifications	<ul style="list-style-type: none"> • Protocol implementation with configurable parameters conforms to the IEC 60870-5-103:1997 • Master supports connecting up to 16 IEDs • Process Information in Monitor and Control Direction • Unbalanced Modes
Supported Functions	<ul style="list-style-type: none"> • Station Initialization, Supports reset FCB and CU • General Interrogation • Clock Synchronization • Command Transmission • Test Mode • Blocking of Monitor Direction
Supported Data Types	<ul style="list-style-type: none"> • Monitor direction: <ul style="list-style-type: none"> * Status indications in monitor direction: from <16> to <30> * Supervision indications in monitor direction: <32>, <33>, from <35> to <39>, <46>, <47> * Earth fault indications in monitor direction: from <48> to <52> * Fault indications in monitor direction: from <64> to <93> * Auto-reclosure indications in monitor direction: from <128> to <130> * Measurands in monitor direction: from <144> to <148> • Control direction: <ul style="list-style-type: none"> * General commands in control direction: from <16> to <19>, from <23> to <26>

IEC 60870-5-104 Server/ Client

General Specifications	<ul style="list-style-type: none"> • Server side supports serving up to 5 client • Client side supports connecting up to 10 IEDs • Protocol implementation with configurable parameters conforms to the IEC 60870-5-104 specification edition 2 • Process Information in Monitor and Control Direction • CP56Time2a timestamp for Control Commands
Supported Functions	<ul style="list-style-type: none"> • Station Initialization • Interrogation • Read Procedure • Cyclic Data and Spontaneous Transmission (Slave Side only) • Clock Synchronization • Transmission of Integrated Totals • Direct and SBO command
Supported Data Types	<ul style="list-style-type: none"> • Monitors Points: Each supports maximum 1000 pts: Single Point, Double Point, Step Position, Bit String, Measured with Normalized Value, Measured with Scaled Value, Measured Short Floating Points Value, Integrated Totals. • Control Points: Each supports maximum 500 pts: Single Command, Double Command, Regulating Step Command, Set Point Command with Normalized Value, Set Point Command with Scaled Value, Set Point Command Short Floating Point, Bitstring. • Event Logging (Server Side only) Universal Event Buffer up to 20,000 Events
